

Zotero-TTS numbers fixture, page one. In the reviewers' 29.83 mm example eye, a scan labelled 3×3 mm covers 3.7×3.7 mm. Vessels in that eye therefore look narrower, their branchpoints denser, and the avascular zone smaller than they are.

About 1,000 eyes were scanned at 0.99 confidence, and 76% of the panel agreed. The pre-trained model had seen 1.6 million images [1]. A magnification error of -20% to +10% is common, and a study last year found none after correction.

The last paragraph has no number in it at all, so every one of its words pairs with the voice on its own, and the highlight simply walks along the line.
